

Insights report

Students: Atef Hammemi, Med Ali Ferchichi, Malek Ammar, Ali Zrida

1. Executive Summary

This project focuses on building a football scouting Business Intelligence solution. The objective is to help clubs identify undervalued players, assess risk, and support data-driven recruitment decisions. Using a large scouting dataset, we designed an ETL pipeline, a dimensional data model, and analytical dashboards supported by meaningful KPIs.

2. Key Analytical Measures (DAX)

Goals per 90 = $\text{SUM}(\text{Goals}) / (\text{SUM}(\text{Minutes Played}) / 90)$

Value Efficiency = $(\text{SUM}(\text{Goals}) + \text{SUM}(\text{Assists})) / \text{SUM}(\text{Market Value})$

YoY Market Value Growth = $(\text{Market Value CY} - \text{Market Value PY}) / \text{Market Value PY}$

3. Key Insights

- Younger players (18–23) show the highest potential upside.
- High minutes played strongly correlate with increased market value.
- Undervalued players often come from smaller leagues.
- Injury risk significantly reduces both minutes and value growth.

4. Business Recommendations

1. Prioritize players aged 18–23 with high potential upside.
2. Target undervalued leagues for recruitment.
3. Avoid high-injury-risk profiles unless discounted.
4. Use value efficiency as a key scouting KPI.
5. Balance disciplinary risk for defensive roles.

5. Limitations & Future Improvements

- Dataset is simulated and not live.
- No real-time injury updates.
- Future work could integrate live APIs and advanced predictive models.

6. Dashboard Design
